## GENERAL SPECIFICATIONS

### Presentation of the Unit

This new series of air-cooled water chillers with helical fans is suitable for outdoor installation: the bearing structure and panelling are made of adequately thick, coated and galvanized sheet metal. All the fastening components are made of stainless and/or galvanized steel. The cabinet that houses the electrical components and all the parts exposed to outdoor weather conditions (fans, pressure switches, valves, etc.) have a protection degree of at least **IP54**.

When the units were designed, particular attention was also paid to sound emission in our endeavour to comply with the increasingly more restrictive laws governing acoustic pollution. The units are therefore available in the basic, silenced and mute versions.

The units produce cold water from 6 to 12°C through to the maximum air temperature of 45/46°C. If equipped with the accessory head pressure control the units can operate at low outdoor temperatures down to about -10°C.

They are equipped with 2 independent refrigerant circuits, each of which has a semi-hermetic **TWIN-SCREW** compressor featuring a 25 to 100% control capacity device.

As part of the standard outfit, the units are also equipped with a shell and tube heat exchanger evaporator optimized for use with **R134a**, featuring high-efficiency grooved pipes and thermally insulated and protected by means of a differential water pressure switch and electrical antifreeze heater that enables the exchanger to be protected against winter freezing down to a min. air temperature = -10°C, coils with extended surfaces and extensive heat exchanging areas formed by copper pipes and louvered aluminium fins, electric fans with scythe-shaped blades to reduce the sound emission, electric panel for setting and controls with a door-locking main circuit-breaker, controller with microprocessor plus display with 4 lines of 20 characters, **R134a** environment-friendly refrigerant gas.

The evaporator is fed by an electronic expansion valve that allows the exploitation of the evaporator surface thus increasing the efficiency of the system in all working conditions (25 to 100%) so achieving the optimal seasonal energy efficiency,

All the units are accurately built and tested individually, thus only the electrical and wet connections need be made for installation.

### Identification code of the unit

The codes that identify the units are listed below and include the sequences of letters that determine the meanings for the various versions and set-ups.

## GENERAL SPECIFICATIONS

### Acoustic versions

The available unit versions are described below:

**AB: Basic Version.** The compressors in these units are installed without a soundproofed cabinet and with axial fans operating at 900 rpm.

**AS: Low Noise Version.** The units are as standard equipped with head pressure control, made with compressors installed inside a soundproofed cabinet, helical fans working at low speed rotation at nominal condition. The unit can work with low noise emission up to an external air temperature of 40°C. Compared with the Basic Version the noise level is reduced of 5/6 dB.

**ASS: Extra Low Noise Version.** The units are as standard equipped with head pressure control, made with compressors installed inside a soundproofed cabinet, helical fans working at very low speed rotation at nominal condition and coils with increased surface. The unit can work with low noise emission up to an external air temperature of 38°C. Compared with the Basic Version the noise level is reduced of 10/11 dB.

### Special versions

The available special versions are described below:

**VB: Basic version.** The unit can produce cold water at a temperature of **6 to 12°C**.

**VD: Version with Desuperheater.** Produces cold water as in the standard version plus hot water at a temperature from 40 to 50°C at the same time. This is achieved thanks to a water-refrigerant gas heat exchanger between the compressors and condensing coils that recovers part of the thermal power that would otherwise be dispersed in the air.

**VR: Version with Total/Partial heat Recovery.** Produces cold water as in the standard version plus hot water at a temperature from 35 to 50°C at the same time. This is achieved thanks to a water-refrigerant gas heat exchanger that totally recovers the thermal power that would otherwise be dispersed in the air. The total heat recovery function is enabled and disabled by means of a valve on the compressor discharge of each circuit: when the temperature of the water that enters the recuperator drops, the valve switches the hot gas flow from the condensing coils to the recovery heat exchanger. On the other hand, when the temperature of the water reaches the set-point, the valve shuts off the heat recuperator and switches the hot gas flow to the condensing coils.

**VI: Version that produces water at a low temperature (BRINE)**

The unit can produce cold water with brine at a temperature of **-8 to 4°C**.

### Description of the components

**1. Fans.** These are the helical type with scythe-shaped blades to increase efficiency and reduce the sound emissions. The fans are directly coupled to the threephase motor by means of an external rotor. Thermal protection against operating faults is installed inside the winding.

### 2. Electric control and monitoring panel.

It is housed in a cabinet made of adequately thick painted sheet metal suitable for outdoor installation (protection degree IP 54). The panel comprises the following main components:

- Main door-locking circuit-breaker.
- Contactors to control and manage the part-winding or star-delta starting mechanism of each compressor.
- Fuse holders with protection fuses for each compressor.
- Fuse holders with protection fuses for the oil heaters of the compressors.
- Fuse holders with protection fuses for the antifreeze heater.
- Fuse holders and protection fuses for the fans.
- Fan control contactors.
- Insulating and safety transformer to power the auxiliaries, protected with fuses.
- Basic monitoring board with microprocessor:
- Electronic expansion valve controller

### The main functions of the monitoring system are:

Temperature regulation of the water produced by the unit, operating hour counting for compressors and pump/s, operating hour balancing for compressors and pumps, start-up timing, parameter entry digitized via the keyboard, alarm diagnosis.

**Functions associated with the digital inputs:** high and low pressure, high discharge temperature, correct electric power phase presence-sequence, thermal protection for compressors, thermal protection for fans, thermal protection for pump, differential water pressure switch, remote controlled ON/OFF commands.

**Functions associated with the digital outputs:** compressor control, solenoid valve for compressor control capacity, liquid solenoid valve control, water pump/s control, electric antifreeze heater, ventilating step control for condensation control function, general alarm (can be remote controlled).

**Functions associated with the analog inputs:** water inlet and outlet temperatures, coil temperature.

Suction and discharge pressure, oil pressure, delivery temperature probe. Suction temperature, liquid temperature, liquid probe.

**Functions associated with the analog outputs:** speed control (only with DCC Head pressure control accessory).

### 3. User interfacing terminal with display.

The interface consists of:

- FUNCTION/ON-OFF multifunction key for quick access to the 4 main menus and for powering/switching off.
- MENU multifunction key to access all the menus for controlling and configuring the unit.
- **Power-on LED.**
- **RX-TX LED** to indicate that the user interface and monitoring module are communicating.
- **Alarm indicator LED.**
- Check-control with alarm display.

## GENERAL SPECIFICATIONS

**4. Bearing structure** made of galvanized sheet metal coated with polyurethane powder paint to ensure good protection against adverse weather conditions.

**5. Condensing coils**, the aluminium finned pack type with shaped profile to increase the heat exchange coefficient and with copper pipes arranged in staggered rows. A sub-cooling section is integrated into the lower part.

**6. Covering panels**, made of galvanized sheet metal coated with polyurethane powder paints to ensure the utmost ability to withstand adverse weather conditions.

**7. Compressor cabinet (only for AS and ASS)**. They are installed in a soundproofed booth made of galvanized sheet metal coated with polyurethane powder paints and covered in soundproofing material.

**8. Compressors**. Suitable for outdoor installation. They are the **TWIN-SCREW type with 25 to 100% control capacity**: in conjunction with accurate assembly, this technical solution allows the refrigerant to compress and the axial thrusts on the bearings (amongst the most critical components of the compressor) to be perfectly balanced, thus guaranteeing long life.

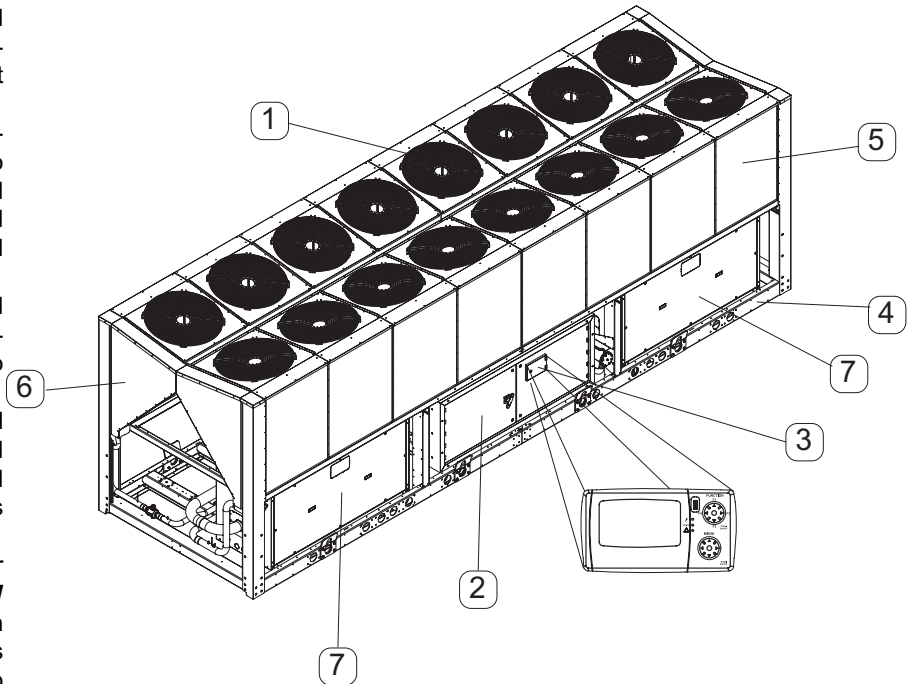

They are equipped with an asynchronous three-phase motor (400V-3-50Hz) with aluminium squirrel-cage rotor, pre-engineered for part-winding or star-delta starting (so as to reduce the current input during the starting phase to the minimum) and are protected by a chain of thermostats buried in the stator windings (controlled by an electronic module) and fuses housed in the electric panel.

The standard outfit includes an efficient oil separator complete with electric heater (activated when the compressor stops). To widen the field of application to an even greater extent, some models are equipped with a liquid injection system controlled by the electronic controller so that use only occurs when effectively necessary.

As part of the standard supply, they are positioned on rubber vibration dampers to reduce the vibrations transmitted to the base of the unit.

**9. Evaporator** of the shell and tube heat exchanger type, made of carbon steel and optimized for operation with **R134a**. Features high-efficiency grooved pipes and also achieves low losses on the wet side.

As standard, the evaporator is insulated with 19mm flexible closed-cell foam that forms barrier to prevent the formation of condensation and heat exchanges towards the outside. Standard supply also includes a differential water pressure switch built into the water supply circuit to avoid the risk of freezing if the water flow is shut off for some reason and electrical antifreeze heater that enables the exchanger to be protected against winter freezing down to a min. air temperature = -10°C. Also ensures that mechanical stress is absorbed to a good degree. As accessory it can be supplied with Water flow switch FA.

### Hydraulic and refrigerant circuit components

**10. Refrigerant safety valve**. (Conforms to the Directive governing pressurized equipments - PED) Installed on the delivery pipe of the compressors. It acts if critical service faults should occur.

**11A. Liquid cock - 11B. Gas cock**. Allow all the refrigerant in the coils to be pumped and then stored so as to carry out servicing work or to replace all the components of the chilling circuit without having to drain it.

**12. Dehydrator filter**. Of the removable cartridge type. Retains impurities and traces of moisture in the circuit.

**13. Liquid injection solenoid valve**, to allow a larger operating envelope directly managed by electronic controller.

**14. Electronic expansion valve**. It has the task of correctly feeding the evaporator insuring a steady superheat. The valve is managed by a dedicated electronic board. It has also the function to stop the liquid when the compressor is off, so avoiding the refrigerant migration from the coils to the evaporator and to the compressor.

- **Liquid injection solenoid valve**. One per circuit. They shut off when the compressor switches off, preventing liquid refrigerant from flowing towards the evaporator during standstill periods.

**15. Compressor delivery probe**. One per compressor, installed on the delivery pipe to protect the compressor if the end of compression temperature exceeds the established limits.

- **Economizer**. The refrigerant circuit for some models is integrated with an economizer. This device increases the cooling capacity and efficiency (EER) of the unit at all operating conditions of the compressor (from 25% to 100%).

## GENERAL SPECIFICATIONS

**Liquid and moisture sight glass.** Signals when liquid passes through the circuit, indicating that the refrigerant charge is correct. The liquid indicator also changes colour to show the amount of moisture in the refrigerant.

- **Pressure taps:** 1/4 " SAE (7/16" UNF) (schraeder). Allow the operating pressure of both the circuits to be measured in 3 main points of each refrigerant circuit: compressor discharge, thermostatic valve inlet, compressor suction.

- **High pressure switch.** With fixed setting. It is installed on the delivery pipe and blocks the compressor of the circuit if the operating pressures exceed the tolerated values. If it activates, the circuit will block and can only be restarted by resetting via the user interface terminal.

- **Oil crankcase heater** to heat the compressor oil. One per compressor. Activated when the compressor switches off. Their task is to keep the temperature of the oil sufficiently high so as to prevent refrigerant from migrating during these pauses.

- **Low pressure switch.** With fixed setting. It is installed on the suction pipe and blocks the compressors if the operating pressures drop below the tolerated values. Automatically resets as the pressure increases. If it activates frequently, the unit will block and can only be restarted by resetting via the user interface terminal.

### Recovery Version components VD / VR

**16. Heat recovery exchanger.** Specially designed for the specific version. Plate type or shell and tube, it is insulated with 19mm flexible closed-cell foam that forms barrier to prevent heat exchanges towards the outside. On request for some models it can be equipped with an electric antifreeze heater to prevent the components from freezing during winter periods at a standstill if the unit is not drained.

### Only Recovery Version VR

**17. Heat recovery management valve.** This delivers refrigerant to the condensing coils or heat recovery exchanger, depending on demands for hot water.

**18. Liquid receiver.** This is a plenum tank that accounts for the refrigerant charge variations required by the machine as the operating modes change (condensing in air or in water).

- **Differential water pressure switch** that disables the heat recovery function if water fails to flow to the exchangers.

- **Liquid solenoid valves.** Allow the refrigerant charge to be recovered after operating mode changes from recovery to cooling and vice versa.

- **One-way valves.** Make the refrigerant obligatorily pass through the appropriate heat exchangers (coils / heat recuperator), depending on the operating mode.

## ACCESSORIES AND OPTIONAL EQUIPMENT

---

### Available accessories

---

**NOTE: The accessories can be of the following type:**

**(M):** only installed in the factory.

**(F):** supplied for installation by the customer.

**MP (F) Storage and Pumping Module (Storage on the Delivery or Storage on Return).** The purpose of the storage and pumping module is to lower the number of compressor surges, increasing the amount of water in the system and, thus, its thermal inertia. It consists of a base made of galvanized and painted sheet metal and aluminium sheet panelling suitable for outdoor installation.

Designed for connection alongside the chiller, the accessory comprises an insulated carbon steel tank, a **single or double centrifugal pump** with on-off valves, an electric power panel, expansion tank, safety valve, air vent, pressure gauge and filling and draining valves.

**FLS (M) Water paddle flow switch.**

**RAG 8 (M) Antifreeze heating element for Pumping Module Water tank.**

**GM (M) Pressure gauge unit.** This consists of low pressure gauges and high pressure gauges (one low and one high pressure gauge for circuit).

**GP (M) Protective guard for the coils.** Consisting of metal guard that protect the coils.

**GP (M) Anti-intrusion guard.** Consisting of metal guard that protect the acces to hydraulic and refrigerant circuit.

**RB(M) Compressor suction shut-off valve.**

**AVM (F) Spring vibration dampers.** Consisting of an adequate number of spring vibration dampers, which varies depending on the model, to install under the unit. They reduce the mechanical vibrations generated by the compressor and fans during their normal operation, that are then transmitted to the bearing surface of the machine. The insulation degree provided by the vibration dampers is about 90%.

**OP (F) Programmer Clock,** applied to the remote ON/OFF function.

**CR (F) Remote Control.** Repeats the functions of the control system installed in the unit, thus allowing this latter to be controlled at a distance (up to 100 m) from the unit.

**INT (M) RS485 Serial interface,** for communication with the MODBUS protocol.

**CSF (M) Voltage monitor and sequence meter.** The device enables control of the correct sequence of power phases and the lack of any phases. It also ensures that the unit works within  $\pm 10\%$  the rated voltage (MIN=360 V - RATED=400V - MAX=440V). It blocks the unit if the voltage is outside the limits provided for.

**DCC (M) Head pressure control** (as standard per low noise version AS and per Extra low noise version ASS).

The device is made by 2 electrical drivers that, by means of phase cutting, control the fans speed rotation, with the scope of maintaining the condensation pressure inside the correct operating limits.

---

### Mechanical options

---

**Special finned heat exchangers**

- Coils with copper fins
- Coils with aluminium fins with black cataphoresis treatment

---

### Electrical options

---

**For power supply voltage different from 400V-3ph~50Hz contact our Sales Office.**

## GENERAL SPECIFICATIONS - IR UNIT FOR COOLING MODE ONLY

#### NOTES:

(1): The data refer to: Water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C D.B.

### Specifications of coils with extended surfaces

Type	Copper pipes notched aluminium fins												/	
Quantity	4												N°	
Total area	18			22.4			26.9			31.4			35.9	m²

### Noise levels

Total SWL	98	98	98	98	100	100	100	101	101	102	102	103	dB(A)
SPL 1 m	79	79	79	79	80	80	80	80	80	81	81	82	dB(A)
SPL 5 m	71	71	71	71	72	72	72	73	73	74	74	75	dB(A)
SPL 10 m	66	66	66	66	67	67	67	69	69	69	69	70	dB(A)

The noise levels refer to units operating in the nominal conditions (water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C). The acoustic pressure levels are measured 1/ 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

**SWL** = Sound power levels, with reference to  $2 \times 10^{-12}$  W.

The **Total** sound power level in **dB(A)** measured in compliance with **ISO 9614** standards, is certified according to the **Eurovent** certification program.

Eurovent certification (**E**) exclusively refers to the **Total** Sound Power in **db(A)**, which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL** = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.

The sound pressure levels are values calculated by applying the **ISO-3744 relation (Eurovent 8/1)** and refer to a distance of 1 meter away from the external surface of units operating in the open field with directivity factor 2 and the units operating in nominal conditions in the cooling mode.

TW= Outlet water temperature °C

kWf = Cooling capacity (kW).

kWa = Compressor power input (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

## GENERAL SPECIFICATIONS - IR UNIT FOR COOLING MODE ONLY

### Acoustic Version: AS (Low noise version)

The following data refer to an IR unit using R134a refrigerant

#### NOTES:

(1): The data refer to: Water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C D.B.

### Specifications of coils with extended surfaces

Type	Copper pipes notched aluminium fins												/	
Quantity	4												N°	
Total area	18			22.4			26.9			31.4			35.9	m²

### Noise levels

Total SWL	93	93	93	93	94	94	94	96	96	97	97	98	dB(A)
SPL 1 m	73	73	73	73	74	74	74	75	75	75	75	76	dB(A)
SPL 5 m	65	65	65	65	67	67	67	68	68	69	69	69	dB(A)
SPL 10 m	61	61	61	61	62	62	62	63	63	64	64	65	dB(A)

The noise levels refer to units operating in the nominal conditions (water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C). The acoustic pressure levels are measured 1/ 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

**SWL** = Sound power levels, with reference to  $2 \times 10^{-12}$  W.

The **Total** sound power level in **dB(A)** measured in compliance with **ISO 9614** standards, is certified according to the **Eurovent** certification program.

Eurovent certification (**E**) exclusively refers to the **Total** Sound Power in **db(A)**, which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL** = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.

The sound pressure levels are values calculated by applying the **ISO-3744 relation (Eurovent 8/1)** and refer to a distance of 1 meter away from the external surface of units operating in the open field with directivity factor 2 and the units operating in nominal conditions in the cooling mode.

11	1.369	339	1.294	365	1.224	393	1.153	420	1.111	437	-	-	

TW= Outlet water temperature °C

kWf = Cooling capacity (kW).

kWa = Compressor power input (kW)

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

: in these working points the unit works with fans at the maximum speed.

## GENERAL SPECIFICATIONS - IR UNIT FOR COOLING MODE ONLY

**Acoustic Version: ASS (Extra Low Noise Version)**

#### NOTES:

(1): The data refer to: Water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C D.B.

### Specifications of coils with extended surfaces

Type	Copper pipes notched aluminium fins												/				
Quantity	4												4/8	N°			
Total area	18			22.4			26.9			31.4			35.9			44.9	m²

### Noise levels

Total SWL	87	87	87	87	88	88	90	91	91	92	92	93	dB(A)
SPL 1 m	67	67	67	67	68	68	69	69	69	70	70	71	dB(A)
SPL 5 m	59	59	59	59	61	61	62	63	63	63	63	65	dB(A)
SPL 10 m	55	55	55	55	56	56	57	58	58	59	59	60	dB(A)

The noise levels refer to units operating in the nominal conditions (water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C). The acoustic pressure levels are measured 1/ 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

**SWL** = Sound power levels, with reference to  $2 \times 10^{-12}$  W.

The **Total** sound power level in **dB(A)** measured in compliance with **ISO 9614** standards, is certified according to the **Eurovent** certification program. Eurovent certification (**E**) exclusively refers to the **Total** Sound Power in **db(A)**, which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL** = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.

The sound pressure levels are values calculated by applying the **ISO-3744 relation (Eurovent 8/1)** and refer to a distance of 1 meter away from the external surface of units operating in the open field with directivity factor 2 and the units operating in nominal conditions in the cooling mode.

Brine percentage	40%						
freezing point [°C]	-22						
Produced water temperature	4	2	0	-2	-4	-6	-8
Refrigerating power c.f.	0,884	0,827	0,770	0,710	0,655	0,598	0,547
Power input c.f.	0,880	0,870	0,860	0,840	0,810	0,790	0,760
Water flow rate c.f.	1,062	0,970	0,887	0,810	0,740	0,670	0,607
Loss of head c.f.	1,542	1,279	1,061	0,880	0,730	0,580	0,461

A calculation example showing how the table is used is given below.

Consider unit **IR 590.2** in the Basic Version with:

- Refrigerating power of the Basic Version unit (VB):  $P_{f_{VB}} = 594 \text{ kW}$
- Power draw of the Compressors in the Basic Version unit (VB):  $Pass_{CP,VB} = 191 \text{ kW}$
- Water Flow Rate of the Basic Version unit (VB):  $Q_{VB} = 28.4 \text{ l/s}$
- Load losses of the Basic Version unit (VB):  $\Delta p_{VB} = 53 \text{ kPa}$
- with 30% brine and -2°C temperature of the water produced

The corresponding values for the Brine Version are:

- Refrigerating power  $P_{f_{VI}} = P_{f_{VB}} \times (0.725) = 431 \text{ kW}$
- Compressor power draw  $Pass_{CP,VI} = Pass_{CP,VB} \times (0.92) = 176 \text{ kW}$
- Water flow rate  $Q_{VI} = Q_{VB} \times (0.81) = 23 \text{ l/s}$
- Losses of head  $\Delta p_{VI} = \Delta p_{VB} \times (0.88) = 47 \text{ kPa}$

If you need to calculate the performances of the unit with outdoor air temp. different than 35°C, you have to use the values for  $P_{f_{VB}}$  and  $Pass_{CP,VB}$  reported on the tables standard performances for the requisited air temp. and with water leaving temp=7°C.

With  $P_{f_{VB}}$  calculate  $Q_{VB}$  and using the graph water pressure loss Basic Version you have  $\Delta p_{VB}$ . Then apply the corrective coefficients indicated on the tables for VI.

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \text{ K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

TWE: Evaporator outlet water temperature (°C)

TWR: Recovered water temperature (°C)

## TECHNICAL SPECIFICATIONS FOR RECOVERY VERSION IR UNITS FOR COOLING ONLY

### Version with total recovery on all circuits (VR)

#### Recovery heat exchanger specifications

Type of recovery exchanger	A										B		
Quantity	2												N°
Max. operating pressure on wet side	1000												kPa
Total water content of recovery exchangers	40	42	42	55	60	75	75	86	100	105	115	115	l

**A:** STAINLESS STEEL BRAZE PLATES

**B:** SHELL AND TUBE

The data refer to: Water temperature: evaporator inlet :12°C - evaporator outlet: 7°C, Outdoor air temperature 35°C.

The data refer to: Water temperature: recovery inlet :40°C - recovery outlet: 45°C (except mod. 1150.2 39/45°C).

The standard performances refer to a 5°C temperature difference between the water entering and leaving the heat exchanger and to operation of the unit with all fans at top speed. A  $0.44 \times 10^{-4} \text{ m}^2 \cdot \text{K/W}$  fouling factor has also been considered with the unit installed at zero meters above sea level (Pb = 1013mbar).

**TWE:** Evaporator outlet water temperature (°C)

**TWR:** Recovered water temperature (°C)

## NOISE LEVELS

The noise levels refer to units operating in the nominal conditions (water temperature: inlet: 12°C - outlet: 7°C, Outdoor air temperature 35°C). The acoustic pressure levels are measured 1/ 5 / 10 meters away from the outer surface of the unit operating in the free field and resting on a reflecting surface (directional factor of 2).

**SWL** = Sound power levels, with reference to  $2 \times 10^{-12}$  W.

The **Total** sound power level in **dB(A)** measured in compliance with **ISO 9614** standards, is certified according to the **Eurovent** certification program.

Eurovent certification (**E**) exclusively refers to the **Total** Sound Power in **dB(A)**, which is therefore the only binding acoustic specification (the values of the Octave bands in the table are indicative).

**SPL** = Sound pressure levels, with reference to  $2 \times 10^{-5}$  Pa.

The sound pressure levels are values calculated by applying the **ISO-3744 relation (Eurovent 8/1)** and refer to a distance of 1 meter away from the external surface of units operating in the open field with directivity factor 2 and the units operating in nominal conditions in the cooling mode.

## OPERATING RANGE

### Operating range Basic Version

The table below lists the operating ranges within which correct operation of the units is guaranteed, depending on the Version and Operating Mode available for each type of unit.  
Remember that in Heat Pump units, heat recovery only takes place during operation in the cooling mode.

### Operating range of Basic Version

Thermal gradient of the water		Limit value
<b>Minimum</b>	°C	4
<b>Maximum</b>	°C	8

- With accessory Head pressure control (brine is recommended)
- With accessory Head pressure control (standard for AS e ASS)

### Operating range for Recovery version

Version	Limit value
with Desuperheater (VD)	<b>Recovery water temp. from 40 to 50°C</b> (Refer to Desuperheater Standard Performances table)
Total Recovery (VR)	See graphic below

## WATER PRESSURE DROP BASIC VERSION

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**. The operating range is delimited by the minimum and maximum values given in the next table.

### Operating range

Unit Size		330.2	370.2	420.2	470.2	510.2	590.2	670.2	740.2	800.2	900.2	1000.2	1150.2	UM	NOTES
Graph reference		1	2	3	4	5	6	7	8	9					<b>Q</b> = Water flow rate <b>Δp</b> = Water pressure drop
Lower limit value	<b>Q</b>	10	14	16	17	21	23	24	32	32	l/s				
	<b>Δp</b>	20										kPa			
Upper limit value	<b>Q</b>	23	24	32	35	42	50	57	59	77	77	l/s			
	<b>Δp</b>	120										kPa			

## WATER PRESSURE DROP DESUPERHEATER VERSION

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**. The operating range is delimited by the minimum and maximum values given in the next table.

### Operating range

Unit Size		330.2	370.2	420.2	470.2	510.2	590.2	670.2	740.2	800.2	900.2	1000.2	1150.2	UM	NOTES
Graph reference		1			2		3		4	5	6				<b>Q</b> = Water flow rate <b>Δp</b> = Water pressure drop
Lower limit value	<b>Q</b>	2		3		4		5	7				l/s		
	<b>Δp</b>	10											kPa		
Upper limit value	<b>Q</b>	13		18		21		25	32				l/s		
	<b>Δp</b>	80											kPa		

## WATER PRESSURE DROP RECOVERY VERSION

The graph below illustrates the water pressure drop values in **kPa** depending on the flow rate in **liters/second**. The operating range is delimited by the minimum and maximum values given in the next table.

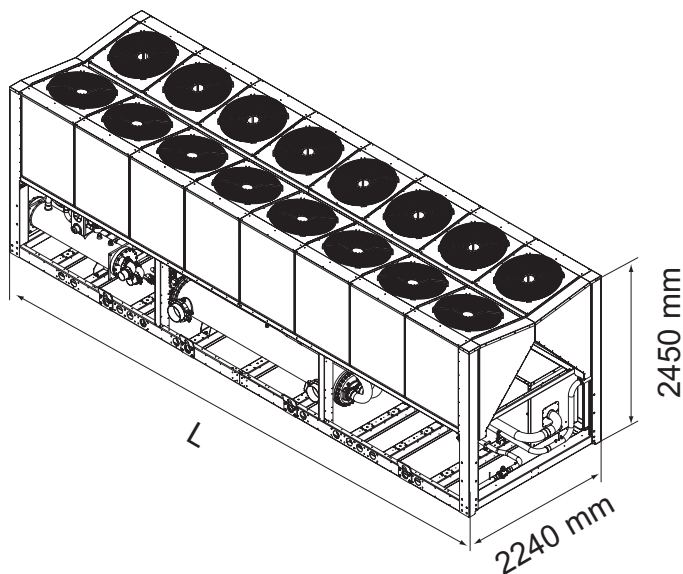

### Operating range

Unit Size	330.2	370.2	420.2	470.2	510.2	590.2	670.2	740.2	800.2	900.2	1000.2	1150.2	UM	NOTES
Graph reference	1		2	3	4	5	6	7	8	9				<b>Q</b> = Water flow rate <b>Δp</b> = Water pressure drop
Lower limit value	<b>Q</b>	19	21	22	26	27	32	38	41	45	l/s			
	<b>Δp</b>	20										kPa		
Upper limit value	<b>Q</b>	41	45	48	58	60	70	83	91	100	l/s			
	<b>Δp</b>	100										kPa

(1) Operating weight of the VB unit of the heaviest series - Extra low noise Version

### Minimum space required for operation

Refer to the figure alongside for the dimensions of the unit.

To correctly install the unit, comply with the measurements for the free area that must be left around the machine, as shown in the figure.

The distances must be doubled if the unit is to be installed in a pit.

**NOTE: Allow for a clear area of not less than 2.5 meters above unit.**

The functional areas must be doubled if multiple units are installed.

### Victaulic connections

These comprise two wet connections of the Victaulic type (Fig. 1-A) composed by steel joint (Fig. 1-B) and rubber packing not installed (supplied with the unit). The steel joints are suitable to be welded or threaded.

The manufacturer declines all responsibility for any inaccuracies in this manual due to printing or typing errors. The reserves the right to modify the products contents in this catalogue without previous notice.
